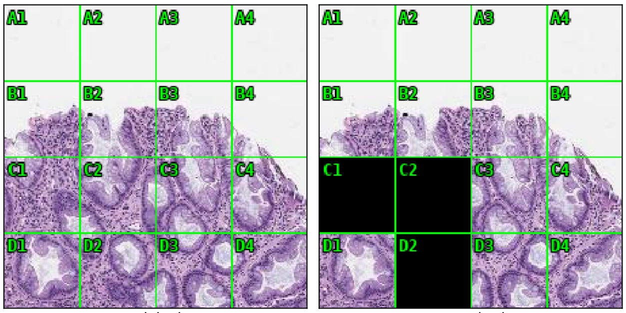
FLIPPED — masking changes the label

A Grid: cited cells blacked out ➞ flips



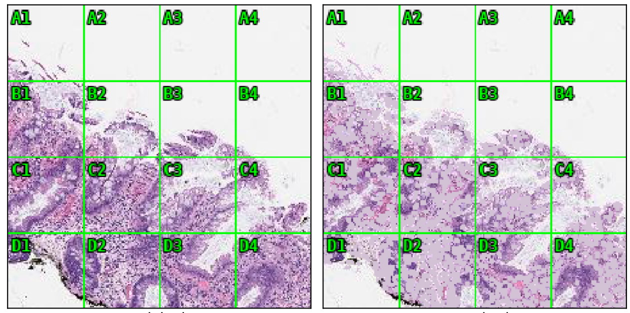
original perturbed

serration → B1 B2 B3: "Saw-tooth folds in the upper crypts near the surface."

crypt/gland architecture → C1 C2 D1 D2: "Crypts are straight, no basal dilation or distortion."

gemma: HP 0.80 ➞ SSA 0.85 after masking C1 C2 D2

B Biology: nuclei masked — never cited ➞ flips



original perturbed

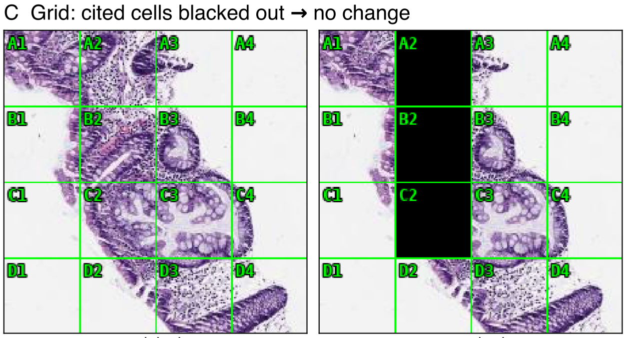
cited: crypt/gland architecture, serration, inflammatory infiltrate — "horizontal growth and basal dilatation…"

nuclear atypia / mitotic figures: cited on 0 of 26 responses

gemma: SSA 0.80 ➞ HP 0.80 after masking segmented nuclei

UNCHANGED — the model's own evidence is removed, verdict identical

C Grid: cited cells blacked out ➞ no change



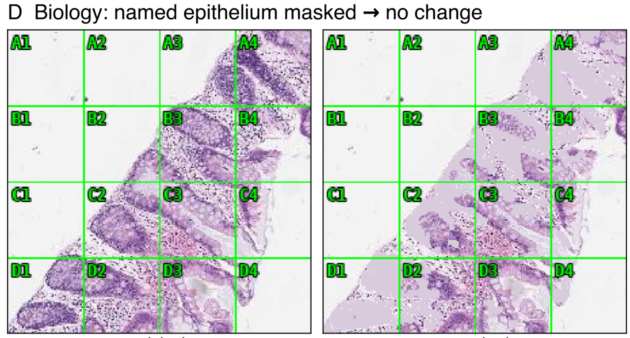
original perturbed

crypt/gland architecture → C2 C3: "Basal dilation and a boot-shaped configuration."

serration → B2 B3 C2 C3: "Sawtooth-like indentations along the crypt walls."

gemma: SSA 0.80 ➞ SSA 0.80 after masking A2 B2 C2

D Biology: named epithelium masked ➞ no change



original perturbed

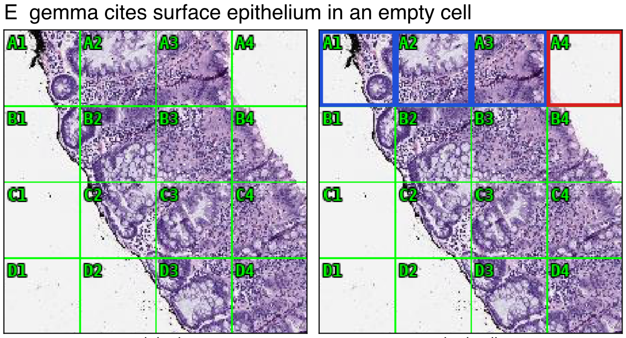
crypt/gland architecture → B3 C2 C3 D1 D2: "Basal dilation and expanded, distorted shapes…"

epithelium-mapped features cited on every tile; here the entire epithelial compartment is filled in

gemma: SSA 0.85 ➞ SSA 0.80 with 44% of tissue masked

ABSENT — cited feature localised to a cell of bare glass

E gemma cites surface epithelium in an empty cell



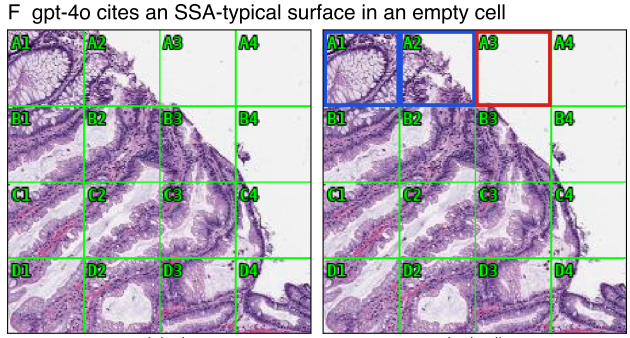
original cited cells

surface epithelium → A1 A2 A3 A4: "The surface epithelium shows modest serrations and is continuous with the underlying crypts."

cell A4 (red) contains 1.9% tissue — bare slide glass

stated label: SSA 0.80

F gpt-4o cites an SSA-typical surface in an empty cell



original cited cells

surface epithelium → A1 A2 A3: "The surface epithelium exhibits a saw-tooth appearance, typical of SSA."

cell A3 (red) contains 0.8% tissue — bare slide glass

stated label: SSA 0.90
